

# HOUSE BILL NO. 1722

## 92ND GENERAL ASSEMBLY

---

INTRODUCED BY REPRESENTATIVES COOPER (155) (Sponsor), DAVIS (19), NIEVES,  
EMERY AND STEVENSON (Co-sponsors).

Read 1<sup>st</sup> time April 7, 2004, and copies ordered printed.

STEPHEN S. DAVIS, Chief Clerk

5031L.011

---

### AN ACT

To amend chapter 170, RSMo, by adding thereto one new section relating to standard science instruction.

---

*Be it enacted by the General Assembly of the state of Missouri, as follows:*

Section A. Chapter 170, RSMo, is amended by adding thereto one new section, to be  
2 known as section 170.018, to read as follows:

**170.018. 1. This section shall be known as, and may be cited as, the "Missouri  
2 Standard Science Act."**

**3 2. As used in this section, the following terms mean:**

**4 (1) "Analogous naturalistic process", a verifiable process which is either a present-  
5 day naturally occurring process similar to a past naturalistic process or the human-  
6 directed duplication of a process similar to a past naturalistic process. The verifiable  
7 process uses similar natural materials, mechanisms, and conditions as the past naturalistic  
8 process and produces an equivalent end result;**

**9 (2) "Biological evolution", a theory of the origin of life and its ascent by naturalistic  
10 means. The first simple life was developed from basic elements and simple molecules  
11 through the mechanisms of random combinations, naturally occurring molecular  
12 structures, other naturalistic means, and millions of years. From the first simple life, all  
13 subsequent species developed through the mechanisms of random variation, mutation,  
14 natural selection, adaptation, segregation, other naturalistic means, and millions of years.  
15 The theory is illustrated by the evolutionary phylogenic tree. Theory philosophically  
16 demands only naturalistic causes and denies the operation of any intelligence, supernatural  
17 event, God or theistic figure in the initial or subsequent development of life;**

**18 (3) "Biological intelligent design", a hypothesis that the complex form and function  
19 observed in biological structures are the result of intelligence and, by inference, that the**

20 origin of biological life and the diversity of all original species on earth are the result of  
21 intelligence. Since the inception of each original species, genetic material has been lost,  
22 inherited, exchanged, mutated, and recombined to result in limited variation. Naturalistic  
23 mechanisms do not provide a means for making life from simple molecules or making  
24 sufficient new genetic material to cause ascent from microscopic organisms to large life  
25 forms. The hypothesis does not address the time or sequence of life's appearance on earth,  
26 time or formation of the fossil record, and time or method of species extinction. The  
27 hypothesis does not require the identity of intelligence responsible for earth's biology but  
28 requires any proposed identity of that intelligence to be verifiable by present-day  
29 observation or experimentation. Concepts inherent within the hypothesis include:

30 (a) The origin of life on earth is inferred to be the result of intelligence directed  
31 design and construction. There are no plausible mechanisms or present-day experiments  
32 to prove the naturalistic origin of the first independent living organism;

33 (b) All original species on earth are inferred to be the result of intelligence directed  
34 design and construction. There are no significant mechanisms or present-day experiments  
35 to prove the naturalistic development of earth's species from microscopic organisms;

36 (c) Complex forms in proteins, enzymes, DNA, and other biological structures  
37 demonstrated by their constituent molecules in regard to size, shape, quantity, orientation,  
38 sequence, chirality, and integration imply intelligent design was necessary for the first life  
39 on earth. Intelligence is capable of designing complex form;

40 (d) Complex functions demonstrated by growth, reproduction, repair, food  
41 metabolization, waste disposal, stimuli response, and autonomous mobility in microscopic  
42 organisms imply intelligent design was necessary for the first life on earth. Intelligence is  
43 capable of designing complex function;

44 (e) Within the history of human experience, all exhibits of recurring discrete  
45 symbols from a set of symbols arranged in a specific sequence which store information and  
46 can be read by human intelligence, is itself the result of intelligence. DNA contains stored  
47 information for the assembling of proteins and enzymes which can be read by humans and  
48 is the result of intelligence. The recurring discrete symbols sequenced within DNA which  
49 store information are the molecules adenine, guanine, cytosine, and thymine;

50 (f) Intelligence-directed design and construction of all original species at inception  
51 without an accompanying genetic burden is inferred rather than random mutational  
52 genetic change as a constructive mechanism. Random mutational genetic change results  
53 in an increasing genetic burden and species degradation rather than species ascent;

54 (g) Intelligence-directed action is necessary to exceed the limits of natural species  
55 change, which is a combination of autogenous species change and environmental effected  
56 species change. Multi-generation breeding experiments illustrate the limits of natural

57 species change and its inadequacy for developing required genetic information found in  
58 dissimilar species;

59 (h) The irreducible complexity of certain biological systems implies a completed  
60 design and construction at inception rather than step-by-step development, as indicated  
61 by the structures observed for sight, hearing, smell, balance, blood coagulation, digestion,  
62 and hormone control;

63 (i) The lack of significant transitional forms between diverse species existing today  
64 and in the fossil record implies all original species were completed at inception rather than  
65 by a step-by-step development from other species. A lack of transitional forms is  
66 illustrated by the appearance of large complex life forms in the Cambrian fossil record  
67 without any significant previous fossils;

68 (j) Common designs and features evident in different species imply the intelligent  
69 reuse of proven designs analogous to the reuse of proven designs by human designers;

70 (k) The lack of significant present-day observable changes in species due to random  
71 variation, mutation, natural selection, adaptation, segregation, or other naturalistic  
72 mechanisms implies intelligence as the cause for all original species;

73 (4) "Destiny", the events and processes that define the future of the universe,  
74 galaxies, stars, our solar system, earth, plant life, animal life, and the human race and  
75 which may be founded upon faith-based philosophical beliefs;

76 (5) "Empirical data", information obtained from observation or experimentation  
77 about the physical universe. The components of observed information include the identity  
78 of the observed object, date of observation, location of observation, means of observation,  
79 observational tools, observing personnel, and recorded observations. The components of  
80 experimental information include the methodology of experimentation, date of experiment,  
81 location of experiment, experimental apparatus, experimenting personnel, and recorded  
82 observations. Empirical data is not speculative, theoretical, hypothetical, inferred, or  
83 extrapolated and of which conjecture;

84 (6) "Equal treatment", the approximate equal teaching of each specified viewpoint  
85 for a single course of instruction in course textbooks as follows:

86 (a) Course textbooks contain approximately an equal number of pages of relevant  
87 material teaching each viewpoint. Textbook materials include text, pictures, illustrations,  
88 graphs, tables, questions, discussion items, student exercises, teacher support material and  
89 other material supplied with the textbook, with freedom allowed the textbook publishers  
90 to arrange, substitute, or size material to provide an approximately equal teaching of each  
91 viewpoint for a specific textbook;

92 (b) In the absence of course textbooks which provide equal treatment, written  
93 interim material may provide alternate viewpoints, with interim textbook material

94 developed pursuant to subsection 6 of this section as a recommended source;

95 (7) "Hypothesis", a scientific theory reflecting a minority of scientific opinion  
96 which may lack acceptance because it is a new idea, contains faulty logic, lacks supporting  
97 data, has significant amounts of conflicting data, or is philosophically unpopular. One  
98 person may develop and propose a hypothesis;

99 (8) "Origin", the events and processes previous to written history that define the  
100 beginning, development, and record of the universe, galaxies, stars, our solar system, earth,  
101 earth geology, earth geography, fossils, species extinction, plant life, animal life, and the  
102 human race, and which may be founded upon faith-based philosophical beliefs;

103 (9) "Scientific theory", an inferred explanation of incompletely understood  
104 phenomena about the physical universe based on limited knowledge, whose components  
105 are data, logic, and faith-based philosophy. The inferred explanation may be proven,  
106 mostly proven, partially proven, unproven or false and may be based on data which is  
107 supportive, inconsistent, conflicting, incomplete, or inaccurate. The inferred explanation  
108 may be described as a scientific theoretical model;

109 (10) "Scientific law", a statement describing specific phenomena about the physical  
110 universe which has been verified by observation or experimentation and has no exceptions  
111 of verified empirical data. The statement may be described by formula;

112 (11) "Standard science", knowledge disclosed in a truthful and objective manner  
113 and the physical universe without any preconceived philosophical demands concerning  
114 origin or destiny. Knowledge is based upon verified empirical data obtained through  
115 observation and experimentation and serves as the factual basis for formulae, events,  
116 processes, principles, and laws and may be a component of theory, hypothesis, conjecture  
117 and extrapolation. Knowledge growth as a result of human endeavor serves as the  
118 foundation for the continuous reevaluation of theory, hypothesis, conjecture, and  
119 extrapolation to determine their correctness based on supporting or conflicting verified  
120 empirical data.

121 3. All science taught in Missouri public elementary and secondary schools,  
122 including material concerning physics, chemistry, biology, health, physiology, genetics,  
123 astronomy, cosmology, geology, paleontology, anthropology, ecology, climatology, or other  
124 science topics shall be standard science. All standard science course materials and  
125 instruction shall meet the following criteria:

126 (1) If empirical data is taught, only such data which has been verified or is  
127 currently capable of being verified by observation or experimentation shall be taught.  
128 Data with the appearance of empirical data which has never been verified and is currently  
129 incapable of being verified shall be identified as nonverifiable when taught orally or in  
130 writing;

131           **(2) If scientific law is taught, written textbooks statements identified as scientific**  
132 **law shall have no known exceptions of verified empirical data;**

133           **(3) If scientific theory is taught, the theory shall be identified as theory when taught**  
134 **orally or in writing. Empirical data and conjecture may be presented to support taught**  
135 **theory where considered instructive. As used in this subsection, the term "theory" shall**  
136 **mean theory or hypothesis;**

137           **(a) If a scientific theory concerning origin or destiny is taught without the teaching**  
138 **of opposing scientific theory, the taught theory may be criticized by the teaching of**  
139 **conflicting empirical data where considered instructive;**

140           **(b) If scientific theory concerning biological origin is taught in a course of study,**  
141 **biological evolution and biological intelligent design shall be taught. Other scientific theory**  
142 **or theories of origin may be taught. If biological intelligent design is taught, any proposed**  
143 **identity of the intelligence responsible for earth's biology shall be verifiable by present-day**  
144 **observation or experimentation and teachers shall not question, survey, or otherwise**  
145 **influence student belief in a nonverifiable identity within a science course;**

146           **(c) If scientific theory concerning biological origin is taught in a textbook, the**  
147 **textbook shall give equal treatment to biological evolution and biological intelligent design.**  
148 **Other scientific theory or theories of origin may be taught;**

149           **(4) If an event previous to written history is taught, the event shall be supported by**  
150 **physical evidence. Physical evidence and data concerning the event may be taught where**  
151 **considered instructive. Conjecture concerning an event previous to written history as to**  
152 **the occurrence of the event, cause of the event, date of the event, length of time for the**  
153 **event to occur, subsequent effects of the event, or other speculative details shall be taught**  
154 **as theory or hypothesis as specified in subdivision (3) of this subsection;**

155           **(5) If a naturalistic process previous to written history is taught, the naturalistic**  
156 **process shall be duplicated by an analogous naturalistic process. Details of the analogous**  
157 **naturalistic process may be taught where considered instructive. Conjecture concerning**  
158 **a naturalistic process previous to written history as to the occurrence of the process, cause**  
159 **of the process, date of the process, length of time for the process to occur, process**  
160 **conditions, process mechanisms, process materials, or other speculative details shall be**  
161 **taught as theory or hypothesis as specified in subdivision (3) of this subsection;**

162           **(6) If a scientific theory or hypothesis proven to be false is taught for historical,**  
163 **illustrative, or other reasons, the theory or hypothesis shall be identified as false when**  
164 **taught orally or in writing.**

165           **4. Textbooks owned by public schools on the date this section becomes law are**  
166 **exempted from the requirements of this section. New textbooks purchased for public**  
167 **schools after the date this section becomes law shall meet the requirements of this section**

168 as specified in subsection 7 of this section.

169       **5. The department of education shall negotiate with textbook publishers to make**  
170 **available textbooks suitable for use in Missouri public elementary and secondary schools**  
171 **which meet the requirements of this section at the earliest practical date and add those**  
172 **textbooks to the prescribed list of textbooks in subsection 7 of this section. Any publisher**  
173 **whose textbook is used by a Missouri public school on the date this section becomes law**  
174 **and certifies to the commission of education that their textbook or a newer version meets**  
175 **the requirements of this section shall have that textbook added to the prescribed list in**  
176 **subsection 7 of this section.**

177       **6. A temporary committee shall be established and serve without compensation to**  
178 **develop supplemental textbook material for interim use by public schools for the teaching**  
179 **of biological intelligent design within two years after this section becomes law. The**  
180 **committee shall consist of nine individuals who are knowledgeable of science and**  
181 **intelligent design and reside in Missouri. Each member of the state board of education and**  
182 **the commissioner of education shall appoint one person to the committee. The**  
183 **supplemental material shall be based on subdivision (3) of subsection 2 of this section and**  
184 **its use by schools shall be optional. Interim supplemental material shall be accessible for**  
185 **copying on the department of elementary and secondary education Internet web site**  
186 **without cost or restriction.**

187       **7. The state commissioner of education shall maintain a list of prescribed textbooks**  
188 **which meet the requirements of this section. The prescribed list shall give the date the**  
189 **textbook was added to the list, textbook title, publisher's name, grade level or levels, course**  
190 **of instruction and other pertinent information, and the prescribed list shall be accessible**  
191 **on the department of elementary and secondary education Internet web site in a**  
192 **conspicuous manner. When the first textbook for a specific course of instruction is added**  
193 **to the prescribed list, then two years following the add date and forward, all new textbooks**  
194 **purchased by the public schools for that specific course of instruction and grade level or**  
195 **levels, whether on the prescribed list or not, shall meet the requirements of this section.**

196       **8. The state commissioner of education shall ensure that any assessment or**  
197 **competency testing of elementary or secondary school pupils for academic performance**  
198 **used and controlled by the state conforms with this section concerning science material**  
199 **within two years after this section becomes law and such test material shall give equal**  
200 **treatment to theories of biological origin in subdivision (3) of subsection 3 of this section.**
